LAB: Credit-1

Use C/C++/Scilab for solving the following problems based on Quantum mechanics like (Use finite difference method, matrix method, ODE Solver method in all cases)

1. Solve the s-wave Schrodinger equation for the ground state and the first excited state of the Hydrogen atom:

$$\frac{d^2 y}{dr^2} = A(r) u(r), A(r) = \frac{2m}{\hbar^2} [V(r) - E], V(r) = -\frac{e^2}{r}$$

Where, 'm' is the reduced mass of the electron. Obtain the energy eigenvalues and plot the corresponding wave functions. Remember that the ground state energy of the hydrogen atom is

$$\sim -13.6 \text{ eV. Take } e = 3.795 \sqrt{(eV \text{ \AA})}, \hbar c = 1973 \text{ (eV \AA)} \text{ and } m = 0.511 \times 10^6 \text{ eV}/c^2.$$

2. Solve the S-Wave radial Schrodinger equation for an atom:

$$\frac{d^2y}{dr^2} = A(r) u(r), A(r) = \frac{2m}{\hbar^2} [V(r) - E],$$

Where, 'm' is the reduced mass of the system (Which can be chosen to be the mass of an electron), for the screened coulomb potential: $v(r) = -\frac{e^2}{r} e^{-r/a}$

Find the energy (in eV) of the ground state of the atom to an accuracy of the significant digits.

Also; plot the corresponding wave function. Take $e = 3.795$ (eVÅ), $\hbar c =$

$1973(\text{eVÅ})$ and $m = 0.511$

$\times 10^6 \text{ eV}/c^2$, and $\alpha = 3\text{Å}, 5\text{Å}, 7\text{Å}$. The ground state energy is expected to be above -12eV in all three cases.

3. Solve the S-Wave radial Schrodinger equation for a particle of mass m:

$$\frac{d^2y}{dr^2} = A(r) u(r), A(r) = \frac{2m}{\hbar^2} [V(r) - E]$$

For the anharmonic Oscillator potential: $V(r) = \frac{kr^2}{2} + \frac{br^3}{3}$.

Find the ground state energy (in MeV) of the particle to an accuracy of three significant digits. Also, plot the corresponding wave function. Choose $m = 940 \text{ MeV}/c^2$, $k = 100 \text{ MeV}/\text{fm}^2$, $b = (0, 10, 30) \text{ MeV}/\text{fm}^3$. In these units, $c = 197.3 \text{ MeV fm}$. [The ground state energy is expected to lie between 90 and 110 MeV for all three cases].

Solve the S-Wave radial Schrodinger equation for the vibrations of hydrogen molecule:

$$\frac{d^2y}{dr^2} = A(r) u(r), A(r) = \frac{2m}{\hbar^2} [V(r) - E]$$

Where, 'm' is the reduced mass of the two-atom system for the Morse potential

$$v(r) = D(e^{-2\alpha r} - e^{-\alpha r})^2$$

Where $r = r - r_0$.

Find the lowest vibrational energy (in MeV) of the molecule to an accuracy of three significant digits.

Also plot the corresponding wave functions for the choices given below:

$m = 940 \times 10^6 \text{ eV}/c^2$, $D = 0.755501 \text{ eV}$, $\alpha = 1.44$, $r_0 = 0.131349 \text{ Åm} = 940 \times 10^6 \text{ eV}/c^2$, $D = 0.755501 \text{ eV}$, $\alpha = 1.44$, $r_0 = 0.131349 \text{ Å}$
